

MARZOLI presents C701 card

From the processing of cotton to artificial, synthetic and technical fibres, the C701 card has been specifically designed to achieve a superior tradeoff between productivity and quality. This has been possible thanks to countless innovations in some

critical areas of the machine, like the feed chute and the carding area.

The two pieces chute with integrated opening system guarantees a perfect opening of the feedstock

and a very even distribution of the flocks with constant pressure on the entire batt surface.

The great carding area, one of the biggest available on the market, with a working width of 1.5 meters, 32 mobile flats in working position and settings held constant by the cast iron structure guarantee outstanding carding performances. When compared to the standard card model with a working width of 1 meter, the C701 allows an increase in production under the same quality level of up to 50% and a reduction in energy consumption of up to 30%. Marzoli is represented by Acmatex Corporation. ♦

LOPTEX solutions for the detection and elimination of contaminants

Loptex offers two solutions for the detection and elimination of contaminants in preparation process: The Sorter Base Centra+ for standard applications for all types of blow room lines. The Sorter Easy Link Centra+ for compact blow room lines where space may be limited. Both systems equally output max 1.200 kg/h.

The Base Centra+ offers a flexible solution to all types of opening lines such as downward fibres flow. Ideal position after an opening point. It offers comprehensive and accurate detection of contaminants by means of following:

(a) The Sonar System for the detection of white PP, transparent and semi-transparent plastics, fluorescent non-fluorescent plastics, plastics with the same colour as the fibrous material.

(b) The Optical System with 24 Embedded Colour Cameras for the

detection of all colour Contamination including very thin light colour PP strings.

The Ultraviolet System with 24 Embedded Colour Cameras for the detection of optically brightened and semi-brightened contamination. It works

Mr. Aarij Iqbal with Mr. Renatto Gerletti.

in a dark area. This is one of the unique Loptex features.

Whereas, the Easy Link Centra+ offers a space saving solution to all compact opening lines such as upward fibres flow, ideal position after an opening point. It also offers comprehensive and accurate detection and elimination of contaminants. ♦
