

Loepfe highlighted Weft-Master TC-1S

Hot wire cutters are the standard tools in weaving processes, when it comes to cutting of woven synthetic fabrics. One of the world's most applied fabric cutter systems is the Weft-Master TC-1S from Loepfe.

A hot wire cutter in combination with a matching control unit, melts the fabric and produces a precise cut or a perfect selvedge.

The method prevents the cut edges from fraying. Controlling the temperature of the cutting wire is crucial, it must be heated to reach the correct melting point to separate the fabric precisely without burning it.

Loepfe offers the new digital thermal cutting control unit WeftMaster CUT-iT

to ensure constant high-quality selvedges. The digital control unit has various innovative features, which ensure top quality output in the weaving mill. Because of the intelligent control, the cutting temperature remains constant during operation. One control unit can operate up to four hot wire cutters at highest power.

The boost mode ensures to reach the temperature needed in a minimum of time during fast machine start-ups. At machine stops, the control unit reduces the temperature immediately to stand-by. Thanks to the exact temperature control, the WeftMaster CUT-iT is a perfect match for cutting sensitive and finest fabrics, which are used in filter materials or medical products.

This new functionality allows operating over 100 cutters in parallel. A typical application is the production of ribbons out of woven fabrics. The new thermal cutting control unit operates with 24 V DC. The power comes from the weaving machine or an industry standard power supply is used.

Loepfe's WeftMaster CUT-iT is the ideal fabric cutter system for thermal cutting from thin and light to dense and heavy synthetic fabrics. All applications with a high quality demand benefit from the innovative solution. Typical applications include carpet backings, airbags, geotextiles, and labels for clothing. ♦
